# Kochen-Specker contextuality 

## Lecture 2

Ana Belén Sainz

Solstice of Foundations summer school - ETH Zurich
20/06/2017

## Yesterday...

- Kochen-Specker contextuality
- KCBS example
- State-independent contextuality
- Inequalities from hypergarphs: CSW approach
- KCBS
- CHSH Bell scenario
- Limitations: ${ }_{3322}$

## Scenarios with operational equivalences

Acín-Fritz-Leverrier-Sainz $\rightarrow$ Dual approach to CSW
CSW: inequalities, AFLS: probabilisitc models

## Scenarios with operational equivalences

Acín-Fritz-Leverrier-Sainz $\rightarrow$ Dual approach to CSW
CSW: inequalities, AFLS: probabilisitc models

- Set of measurements
- Set of outcomes

Events: $(a \mid x)$

## Scenarios with operational equivalences

## Acín-Fritz-Leverrier-Sainz $\rightarrow$ Dual approach to CSW

CSW: inequalities, AFLS: probabilisitc models

- Set of measurements
- Set of outcomes
- Operational equivalences $\rightarrow$ identify outcomes of different measurements: same probability

Events: $(a \mid x)$

## Scenarios with operational equivalences

Acín-Fritz-Leverrier-Sainz $\rightarrow$ Dual approach to CSW
CSW: inequalities, AFLS: probabilisitc models

- Set of measurements
- Set of outcomes
- Operational equivalences $\rightarrow$ identify outcomes of different measurements: same probability

Events: $(a \mid x)$

## Scenarios with operational equivalences

Acín-Fritz-Leverrier-Sainz $\rightarrow$ Dual approach to CSW
CSW: inequalities, AFLS: probabilisitc models

- Set of measurements
- Set of outcomes
- Operational equivalences $\rightarrow$ identify outcomes of different measurements: same probability

Events: $(a \mid x)$

## Scenarios with operational equivalences

Example: two projective measurements.

(1) $\left\{\Pi_{1}, \Pi_{2}, \Pi_{3}\right\}$ associated to outcomes $\left\{v_{1}, v_{2}, v_{3}\right\}$.
(2) $\left\{\Pi_{3}, \Pi_{4}, \Pi_{5}\right\}$ associated to outcomes $\left\{v_{3}^{\prime}, v_{4}, v_{5}\right\}$.

$$
\sum_{i=1}^{3} \Pi_{i}=\mathbb{1}=\sum_{i=3}^{5} \Pi_{i}
$$

Born's rule: $\quad p\left(v_{3}\right)=\operatorname{tr}\left\{\Pi_{3} \rho\right\}=p\left(v_{3}^{\prime}\right) \quad \forall \rho$

## Scenarios with operational equivalences

- Set of measurements
- Set of outcomes
- Operational equivalences $\rightarrow$ identify outcomes of different measurements: same probability

Hypergraph:

- Vertices $\rightarrow$ events - measurement outcome
- Hyperedges $\rightarrow$ complete measurements - set of outcomes

## Probabilistic models

Probabilistic model $\rightarrow$ outcome statistics respecting operational equivalences

## Probabilistic models

Probabilistic model $\rightarrow$ outcome statistics respecting operational equivalences

## Probabilistic model

Given $H=(V, E), \quad p: V \rightarrow[0,1]$
such that
$\mathcal{G}(H)$
$\sum_{v \in e} p(v)=1 \quad \forall e \in E$

## Probabilistic models

Probabilistic model $\rightarrow$ outcome statistics respecting operational equivalences

## Probabilistic model

Given $H=(V, E), \quad p: V \rightarrow[0,1]$
such that
$\mathcal{G}(H)$
$\sum_{v \in e} p(v)=1 \quad \forall e \in E$

## Classical probabilistic models

Classical $\rightarrow$ deterministic noncontextual hidden variables
There are 'hidden variables' that determine (with certainty) which measurement outcome happens, and we only observe an average over them, according to the preparation of our physical system.

## Classical probabilistic models

Classical $\rightarrow$ deterministic noncontextual hidden variables
There are 'hidden variables' that determine (with certainty) which measurement outcome happens, and we only observe an average over them, according to the preparation of our physical system.

## Classical model

A probabilistic model $p: V \rightarrow[0,1]$ is classical iff
$p(v)=\sum_{\lambda} q_{\lambda} p_{\lambda}(v)$,
where $\sum_{\lambda} q_{\lambda}=1$, and $p_{\lambda}$ is a deterministic model for each $\lambda$.

## Classical probabilistic models

Classical $\rightarrow$ deterministic noncontextual hidden variables
There are 'hidden variables' that determine (with certainty) which measurement outcome happens, and we only observe an average over them, according to the preparation of our physical system.

## Classical model

A probabilistic model $p: V \rightarrow[0,1]$ is classical iff
$p(v)=\sum_{\lambda} q_{\lambda} p_{\lambda}(v)$,
where $\sum_{\lambda} q_{\lambda}=1$, and $p_{\lambda}$ is a deterministic model for each $\lambda$.

## Quantum probabilistic models

## Quantum models

A probabilistic model $p: V \rightarrow[0,1]$ is quantum if
$\exists \mathcal{H}, \quad \rho, \quad\left\{P_{v}: v \in V\right\}$
$\sum_{v \in e} P_{v}=\mathbb{1}_{\mathcal{H}} \quad \forall e \in E$
$\mathcal{Q}(H)$
$p(v)=\operatorname{tr}\left(\rho P_{v}\right)$

## Quantum probabilistic models

## Quantum models

A probabilistic model $p: V \rightarrow[0,1]$ is quantum if
$\exists \mathcal{H}, \quad \rho, \quad\left\{P_{v}: v \in V\right\}$
$\sum_{v \in e} P_{v}=\mathbb{1}_{\mathcal{H}} \quad \forall e \in E$
$p(v)=\operatorname{tr}\left(\rho P_{v}\right)$

## State-independent contextuality

Nine measurements of four possible outcomes each.

$$
\mathcal{C}(H)=\emptyset \text { while } \mathcal{Q}(H) \neq \emptyset
$$

## The non-orthogonality graph

"Two events are orthogonal if there exists a hyperedge that contains them both"

$$
H(V, E) \quad \rightarrow \quad \mathrm{NO}(H)
$$

## The non-orthogonality graph

"Two events are orthogonal if there exists a hyperedge that contains them both"

$$
H(V, E) \quad \rightarrow \quad \mathrm{NO}(H)
$$

Example:

Contextuality scenario: H
Non-orthogonality graph: $\mathrm{NO}(\mathrm{H})$

## NO graph and probabilistic models

$$
p \in \mathcal{C}(H) \quad \text { iff } \quad \alpha^{*}(\mathrm{NO}(H), p)=1
$$

## NO graph and probabilistic models

$$
p \in \mathcal{C}(H) \quad \text { iff } \quad \alpha^{*}(\mathrm{NO}(H), p)=1
$$

Quantum models cannot be characterised by the properties of $(\mathrm{NO}(H), p)$

Example: $\exists H, \quad H^{\prime}, \quad p \quad s t:$

- $p \in \mathcal{Q}(H)$
- $p \in \mathcal{Q}_{1}\left(H^{\prime}\right) \backslash \mathcal{Q}\left(H^{\prime}\right)$
- $\mathrm{NO}(H)=\mathrm{NO}\left(H^{\prime}\right)$

## Bell scenarios

$$
p\left(a_{1} \ldots a_{n} \mid x_{1} \ldots x_{n}\right)
$$

## Bell scenarios

## Bell scenarios

Bell scenario $\rightarrow$ events-based hypergraph?

## Bell scenarios

Bell scenario $\rightarrow$ events-based hypergraph?

Alice
Bob

$H_{A}$
$H_{B}$

## Bell scenarios

## Bell scenario $\rightarrow$ events-based hypergraph?

| Alice |  |  |  |  |  | Bob |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $00 \mid 00$ | $01 \mid 00$ | $00 \mid 01$ | 01\|01 |  |  |
| $0 \mid 0$ | 110 |  |  |  |  | 010 | 110 |
| 0 | 0 | $\begin{gathered} 10 \mid 00 \\ 0 \end{gathered}$ | $\underset{0}{11 \mid 00}$ | $\underset{\bigcirc}{10 \mid 01}$ | $\underset{\bigcirc}{11 \mid 01}$ | 0 | 0 |
| $0 \mid 1$ | 1\|1 | 00\|10 | 01\|10 | 00\|11 | 01\|11 | $0 \mid 1$ | 1\|1 |
| 0 | $H_{A}$ |  |  |  |  | $H_{B}$ |  |
|  |  | 10\|10 | 11\|10 | 10\|11 | 11\|11 |  |  |
|  |  | - | - | $\bigcirc$ | - |  |  |

## Bell scenarios

Bell scenario $\rightarrow$ events-based hypergraph?

## Bell scenarios

$$
\text { Bell scenario } \rightarrow \text { events-based hypergraph? }
$$

## Bell scenarios

$$
\text { Bell scenario } \rightarrow \text { events-based hypergraph? }
$$

This choice of hypegraph admits signalling models

## Bell scenarios

Correlated measurements

- temporal order of the parties. e.g. $A \rightarrow B$
- a choice of measurement for the first party, e.g. $x$.
- a function $y=f(a)$ for the second party, that determines its measurement input as a function of the previous party's outcome.

Example:
$(A \rightarrow B, x=0, y=a)$
Correlated measurement with outcomes $\{(00 \mid 00),(01 \mid 00),(10 \mid 01),(11 \mid 01)\}$.

## Bell scenarios

Events-based hypergraph: $\mathcal{B}_{n, m, d}$

- Vertices: events
- Egdes: correlated measurements

## Bell scenarios

Events-based hypergraph: $\mathcal{B}_{n, m, d}$

- Vertices: events
- Egdes: correlated measurements

- $\mathcal{G}\left(\mathcal{B}_{n, m, d}\right)=\mathcal{N S}(n, m, d)$
- $\mathcal{C}\left(\mathcal{B}_{n, m, d}\right)=\mathcal{C}(n, m, d)$
- $\mathcal{Q}\left(\mathcal{B}_{n, m, d}\right)=\mathcal{Q}(n, m, d) \quad \longrightarrow \quad \Pi_{a b \mid x y}=\Pi_{a \mid x} \Pi_{b \mid y}$ with $\left[\Pi_{a \mid x}, \Pi_{b \mid y}\right]=0$

## Bell scenarios

Events-based hypergraph: $\mathcal{B}_{n, m, d}$

- Vertices: events
- Egdes: correlated measurements

- $\mathcal{G}\left(\mathcal{B}_{n, m, d}\right)=\mathcal{N S}(n, m, d)$
- $\mathcal{C}\left(\mathcal{B}_{n, m, d}\right)=\mathcal{C}(n, m, d)$
- $\mathcal{Q}\left(\mathcal{B}_{n, m, d}\right)=\mathcal{Q}(n, m, d) \quad \longrightarrow \quad \Pi_{a b \mid x y}=\Pi_{a \mid x} \Pi_{b \mid y}$ with $\left[\Pi_{a \mid x}, \Pi_{b \mid y}\right]=0$
- $\mathcal{B}_{n, m, d}$ may be computed via the "Foulis-Randall" product of the local hypergraphs.

## Relation to Compatible-observables scenarios

Scenario: $(X, O, \mathcal{M})$

- $X$ : observables
- O: outcomes
- $\mathcal{M}$ : measurement cover $\rightarrow$ sets of compatible measurements
$C \in \mathcal{M}$ measurement context

## Relation to Compatible-observables scenarios

Scenario: $(X, O, \mathcal{M})$

- $X$ : observables
- O: outcomes
- $\mathcal{M}$ : measurement cover $\rightarrow$ sets of compatible measurements
$C \in \mathcal{M}$ measurement context

KCBS:

$$
\begin{gathered}
X=\left\{A_{i}: 1 \leq i \leq 5\right\} \\
O=\{-1,1\} \\
\mathcal{M}=\left\{\left\{A_{1}, A_{2}\right\},\left\{A_{2}, A_{3}\right\},\left\{A_{3}, A_{4}\right\},\left\{A_{4}, A_{5}\right\},\left\{A_{5}, A_{1}\right\}\right\}
\end{gathered}
$$

## Relation to Compatible-observables scenarios

$$
(X, O, \mathcal{M}) \quad \longrightarrow \quad H[X]
$$

- Vertices:
- Hyperedges:

## Relation to Compatible-observables scenarios

$$
(X, O, \mathcal{M}) \quad \longrightarrow \quad H[X]
$$

- Vertices:

$$
(s, C): C \in \mathcal{M}, s \in O^{C}
$$

$$
\text { KCBS: } \quad\left(a_{i} a_{i+1} \mid A_{i} A_{i+1}\right)
$$

- Hyperedges:

## Relation to Compatible-observables scenarios

$$
(X, O, \mathcal{M}) \quad \longrightarrow \quad H[X]
$$

- Vertices: $\quad(s, C): C \in \mathcal{M}, s \in O^{C}$

$$
\text { KCBS: } \quad\left(a_{i} a_{i+1} \mid A_{i} A_{i+1}\right)
$$

- Hyperedges: Measurement protocols
- Choose and measure an observable ( $A$ ).
- Depending on the outcome, choose a compatible observable ( $A^{\prime}$ ).
- Measure ( $A^{\prime}$ ), $\ldots$

## Relation to Compatible-observables scenarios

$$
(X, O, \mathcal{M}) \quad \longrightarrow \quad H[X]
$$

- Vertices: $\quad(s, C): C \in \mathcal{M}, s \in O^{C}$

$$
\text { KCBS: } \quad\left(a_{i} a_{i+1} \mid A_{i} A_{i+1}\right)
$$

- Hyperedges: Measurement protocols

KCBS:

- Choose and measure an observable ( $A$ ).
- Depending on the outcome, choose a compatible observable $\left(A^{\prime}\right)$.
- Measure ( $A^{\prime}$ ), ...

$$
f:\{1,-1\} \rightarrow\left\{A_{k-1}, A_{k+1}\right\}
$$

## Contextuality bundles

$\rightarrow$ Logical Contextuality

## Summary of today

- Scenarios from operational equivalences
- Define sets of probabilistic models
- Graph theoretical advantages
- Bell scenarios
- Compatible-observables scenarios (S. Abramsky and A. Brandenburger, New J. Phys. 13(11), 113036 (2011).)
A. Acín, T. Fritz, A. Leverrier, A.B. Sainz, Comm. Math. Phys. 334(2), 533-628 (2015).
- Contextuality bundles
S. Abramsky, R. Soares Barbosa, K. Kishida, R. Lal and S. Mansfield, 24th EACSL, CSL 2015, pages 211-228, 2015.

## Closing remarks

- Kochen-Specker contextuality, with focus on graph theory
- Hidden variable models, and quantum violations
- Contextuality scenarios: 'observables with compatibility relations', or 'events with operational equivalences'.
- Types of probabilistic models $\rightarrow$ graph theory

CSW: contextuality
ALFS: set membership

- Bell scenarios as contextuality ones

## Summary

- Kochen-Specker contextuality
S. Kochen and E. P. Specker, J. Math. Mech. 17, 59 (1967).
- KCBS example
A. A. Klyachko, M. A. Can, S. Binicioğlu, and A. S. Shumovsky, Phys. Rev. Lett. 101, 020403 (2008).
- State-independent contextuality
N.D.Mermin, Phys.Rev.Lett. 65, 3373-6 (1990).
A.Peres, Phys. Lett. A 151, 107-8 (1990).
- Inequalities from hypergarphs: CSW approach
- KCBS, CHSH Bell scenario, Limitations: $I_{3322}$
A. Cabello, S. Severini, A. Winter, arXiv:1010.2163
- Scenarios from operational equivalences
- Graph theoretical advantages, Bell and Compatible-observables scenarios A. Acín, T. Fritz, A. Leverrier, A.B. Sainz, Comm. Math. Phys. 334(2), 533-628 (2015).
- Contextuality bundles
S. Abramsky, R. Soares Barbosa, K. Kishida, R. Lal and S. Mansfield, 24th EACSL, CSL 2015, pages 211-228, 2015.

## Comments on dilation

"Dilation", a.k.a. "The Church of the larger Hilbert space":
Let $p(a \mid x)$ be a probabilistic model in a contextuality scenario. Let us assume that we have a realisation of it in terms of POVMs (i.e. generalised measurements); that is, a Hilbert space $\mathcal{H}$, positive semidefinite matrices $M_{a \mid \times}$ s.t. $\sum_{a} M_{a \mid x}=\mathbb{1}_{\mathcal{H}}$ and a quantum state $\rho$, s.t. $p(a \mid x)=\operatorname{tr}\left\{M_{a \mid \times} \rho\right\}$.

A dilation of this model is a realisation of the correlations in terms of projective measurements, i.e. a Hilbert space $\mathcal{H}^{\prime}$ (possibly of larger dimension than $\mathcal{H}$ ), projectors $\Pi_{a \mid x}$ s.t. $\sum_{a} \Pi_{a \mid x}=\mathbb{1}_{\mathcal{H}^{\prime}}$ and a quantum state $\rho^{\prime}$, s.t. $p(a \mid x)=\operatorname{tr}\left\{\Pi_{a \mid x} \rho^{\prime}\right\}$.

Colloquially, the POVM operators $M_{a \mid x}$ are dilated into projection operators $\Pi_{a \mid x}$.

When can we find a dilation of a POVM model?
The mathematical counterpart of this question was addressed by Naimark and Stinespring in the context of $C^{*}$-algebras. See e.g.,
M. A. Naimark. On a representation of additive operator valued set functions (Russian). Doklady Acad. Nauk SSSR, 41(5):373375, 1943

Vern Paulsen. Completely Bounded Maps and Operator Algebras. Cambridge, University Press, 2003

## Comments on Dilation

Contextuality scenarios:
It is not always possible to dilate a POVM realisation of a probabilistic model, such that the dilated projectors satisfy the same compatibility relations as the original POVM elements.
C. Heunen, T. Fritz and M. L. Reyes, Phys. Rev. A 89, 032121 (2014).
Bell scenarios:

Any POVM realisation of Bell correlations has an equivalent realisation in terms or projective measurements.

Double Stinespring theorem: T. Fritz, Rev. Math. Phys. 24(5), 1250012 (2012). (uses $C^{*}$-algebraic formulation of quantum theory)
V. Paulsen, Lecture notes on "Entanglement and Non-Locality" (Sec. 9), available at http://www.math.uwaterloo.ca/~vpaulsen/ (does not use $C^{*}$-algebras)
